

CamelCase

New words created by smashing together capitalized words.

[CamelCase](#) is the original wiki convention for creating hyperlinks, with the additional requirement that the capitals are followed by a lower-case letter; hence ?Alabama? and ?ABc? will not be links.

Customizing the Wiki behavior

Some people dislike linking by [CamelCase](#). While Trac remains faithful to the original Wiki style, it provides a number of ways to accomodate users with different preferences:

- There's an option (`ignore_missing_pages` in `[wiki]`) to simply ignore links to missing pages when the link is written using the [CamelCase](#) style, instead of that word being replaced by a gray link followed by a question mark.
That can be useful when [CamelCase](#) style is used to name code artifacts like class names and there's no corresponding page for them.
- There's an option (`split_page_names` in `[wiki]`) to automatically insert space characters between the words of a [CamelCase](#) link when rendering the link.
- Creation of explicit Wiki links is also easy, see [WikiPageNames](#) for details.
- In addition, Wiki formatting can be disabled completely in some places (e.g. when rendering commit log messages)

See [TracIni](#) for more information on the available options.
