Table of Contents

7.23 Flow from detritus	3
-------------------------	---

7.23 Flow from detritus

The [Trophic level decomposition](#) analysis calculated the the fractions of the flow from each trophic level through each model group. The *Flow from detritus* analysis is equivalent, but calculates the flow from detritus through each group and converts it to absolute flows ($\text{t/km}^2/\text{year}$). The results are summarized in the *Trophic aggregation analyses* (see [Flows and biomasses](#)).
