

Wiki Processors

Processors are [Wiki Macros](#) designed to provide alternative markup formats for the [Wiki engine](#). Processors can be thought of as *macro functions to process user-edited text*.

Wiki processors can be used in any Wiki text throughout Trac, for various different purposes, like:

- [syntax highlighting](#) or for rendering text verbatim,
- rendering [Wiki markup inside a context](#), like inside <div> blocks or or within <td> or <th> table cells,
- using an alternative markup syntax, like [raw HTML](#) and [Restructured Text](#), or [?textile](#)

Using Processors

To use a processor on a block of text, first delimit the lines using a *Wiki code block*:

```
{{{  
The lines  
that should be processed...  
}}}
```

Immediately after the {{{ or on the line just below, add #! followed by the *processor name*.

```
{{{  
#!processorname  
The lines  
that should be processed...  
}}}
```

This is the "shebang" notation, familiar to most UNIX users.

Besides their content, some Wiki processors can also accept *parameters*, which are then given as key=value pairs after the processor name, on the same line. If value has to contain space, as it's often the case for the style parameter, a quoted string can be used (key="value with space").

As some processors are meant to process Wiki markup, it's quite possible to *nest* processor blocks. You may want to indent the content of nested blocks for increased clarity, this extra indentation will be ignored when processing the content.

Examples

Wiki Markup	Display
<u>Example 1: Inserting raw HTML</u>	
<pre>{{{ <h1 style="color: grey">This is raw HTML</h1> }}}</pre>	This is raw HTML
<u>Example 2: Highlighted Python code in a <div> block with custom style</u>	
<pre>{{{#!div style="background: #ffd; border: 3px ridge" This is an example of embedded "code" block: {{{ #!python def hello(): return "world" }}} }}}</pre>	<div style="background-color: #ffd; border: 3px ridge;"> <p>This is an example of embedded "code" block:</p> <pre>def hello(): return "world"</pre> </div>
<u>Example 3: Searching tickets from a wiki page, by keywords.</u>	
<pre>{{{ #!html <form action="/query" method="get"> <input type="text" name="keywords" value="~" size="30"> <input type="submit" value="Search by Keywords"> <!-- To control what fields show up use hidden fields <input type="hidden" name="col" value="id"> <input type="hidden" name="col" value="summary"> <input type="hidden" name="col" value="status"> <input type="hidden" name="col" value="milestone"> <input type="hidden" name="col" value="version"> <input type="hidden" name="col" value="owner"> <input type="hidden" name="col" value="priority"> <input type="hidden" name="col" value="component"> --> </form> }}}</pre>	

Available Processors

The following processors are included in the Trac distribution:

```
#!default
    Present the text verbatim in a preformatted text block. This is the same as specifying no processor name (and no #!)
#!comment
    Do not process the text in this section (i.e. contents exist only in the plain text - not in the rendered page).
```

HTML related

```
#!html
    Insert custom HTML in a wiki page.
#!htmlcomment
    Insert an HTML comment in a wiki page (since 0.12).
```

Note that `#!html` blocks have to be *self-contained*, i.e. you can't start an HTML element in one block and close it later in a second block. Use the following processors for achieving a similar effect.

```
#!div
    Wrap an arbitrary Wiki content inside a <div> element (since 0.11).
#!span
    Wrap an arbitrary Wiki content inside a <span> element (since 0.11).
#!td
    Wrap an arbitrary Wiki content inside a <td> element (since 0.12)
#!th
    Wrap an arbitrary Wiki content inside a <th> element (since 0.12)
#!tr
    Can optionally be used for wrapping #!td and #!th blocks, either for specifying row attributes of better visual grouping (since 0.12)
```

See [WikiHtml](#) for example usage and more details about these processors.

Other Markups

```
#!rst
    Trac support for Restructured Text. See WikiRestructuredText.
#!textile
    Supported if ?Textile is installed. See ?a Textile reference.
```

Code Highlighting Support

Trac includes processors to provide inline syntax highlighting:

```
#!c (C),#!cpp (C++),#!python (Python),#!perl (Perl),#!ruby (Ruby),#!php (PHP),#!asp (ASP),#!java (Java),#!js
(Javascript),#!sql (SQL),#!xml (XML or HTML),#!sh (Bourne/Bash shell), etc.
```

Trac relies on external software packages for syntax coloring, like [?Pygments](#).

See [TracSyntaxColoring](#) for information about which languages are supported and how to enable support for more languages.

Note also that by using the MIME type as processor, it is possible to syntax-highlight the same languages that are supported when browsing source code. For example, you can write:

```
{{{  
#!text/html  
<h1>text</h1>  
}}}
```

The result will be syntax highlighted HTML code:

```
<h1>text</h1>
```

The same is valid for all other [mime types supported](#).

Developing processors is no different from Wiki macros. In fact they work the same way, only the usage syntax differs. See [WikiMacros#DevelopingCustomMacros](#) for more information.
